Date: December 5th, 2019
RE: **Final location, character, and extent review of sludge thickening and dewatering facility improvements at the Wastewater Treatment Plant, 1400 Brander Street; UDC 2019-30**

I. APPLICANT

Ed Alleyne, City of Richmond, Department of Public Utilities

II. LOCATION

1400 Brander Street

Property Owner:

City of Richmond

III. PURPOSE

The application is for final approval of improvements to the Wastewater Treatment Plant's sludge thickening and dewatering facilities, which includes new equipment, a new electrical building, transformers, and rehabilitation of the existing buildings.

IV. SUMMARY & RECOMMENDATION

The City of Richmond's Wastewater Treatment Plant's sludge thickening and dewatering facilities have been in continuous operation since the 1980's and have begun to require frequent and costly maintenance. The City selected Greeley and Hansen to develop a basis of design report for upgrades to both facilities. Upgrades to these facilities include new centrifuges, a new electrical building and equipment, a new loading building, interior renovations to office space and control rooms, replacement of windows and sound reducing panels, and raising existing HVAC and electrical equipment above the 100-yr flood plain.

With the final application, the Applicant specified that the proposed finish color of new windows, light fixtures, and louvered screens would be Classic II Silver, but after discussion with staff has agreed to change that color to bronze to be in keeping with existing finishes.

Staff has worked with the Applicant to revise the original plans of the proposed Dewatering Facility Loading Building. Upon the Urban Design Committee's request for the loading building to utilize a simpler roof form that is compatible with the industrial nature and aesthetic of the site, the Applicant has submitted a design for the loading building that includes a shed roof instead of the originally proposed gable roof, which is in keeping with the existing architectural character of the site.

Therefore Staff recommends that the Urban Design Committee recommend that the Planning Commission approve the final design as submitted.

V. FINDINGS OF FACT**a. Site Description and Surrounding Context**

The site is located at 1400 Brander Street and lies within the M-2 (Heavy Industrial) zoning district. The property is over one hundred fifty (150) acres in size and is surrounded by other industrial sites, bordered by Brander Street to the North and East, and Interstate 95 to the West.

There are around 40-50 employees working on site, with very limited public access, the exception being occasional staff-facilitated tours of the WWTP.

b. Scope of Review

The improvements associated with this project are subject to location, character, and extent review as a “public building or structure” in accordance with Section 17.07 of the Richmond City Charter.

c. UDC Review History

At the regular November 2019 meeting of the UDC, the conceptual location, character, and extent of sludge thickening and dewatering facility improvements at the Wastewater Treatment Plant, UDC 2019-28 was reviewed, and the UDC recommended that the Planning Commission grant conceptual approval of the project with the following conditions:

- Applicant consider a simpler design for the new loading building that is compatible with the industrial nature and aesthetic of the site
- Applicant submit a context drawing of the new loading building that shows dimensions and scale in relation to the existing dewatering facility.

The Planning Commission granted conceptual approval of the project at a regular meeting on November 18, 2019 with the UDC’s recommendations.

At the regular October 2019 meeting of the UDC, the conceptual location, character, and extent of a new bio solids canopy, UDC 2019-27, was reviewed, and the UDC recommended that the Planning Commission grant conceptual approval; this application was subsequently approved by the Planning Commission at a regular meeting on October 21, 2019.

At the regular May 2019 meeting of the UDC, the final location, character, and extent of new Grit and Screening Facilities, UDC 2019-15 was reviewed, and the UDC recommended that the Planning Commission grant final approval; this application was subsequently approved by the Planning Commission at a regular meeting on May 20, 2019.

At the regular March 2016 meeting of the UDC, the final location, character, and extent review of the CSO Control Program – Special Order 15A, Division 47 – Screenings and Grit Removal Facilities (UDC 2016-07) was recommended for approval and subsequently approved at the regular March 21, 2016 meeting of the Planning Commission.

At the regular December 2016 meeting of the UDC, the project was recommended for conceptual approval by the UDC. The project was canceled in November 2018 due to lack of funding.

In addition:

To be in accordance with state law that called for reducing the concentration of nitrogen and phosphorus that is discharged into the James River, a project was proposed that would be implemented through several contracts. The UDC reviewed several submittals under the project number UDC 07-37 (2,3,4,5,6,7) between 2007-2010 for the construction of new buildings and infrastructure on site that would bring the plant into compliance.

Final location, character, and extent of the installation of a double-wide modular unit at 1400 Brander Street was approved as submitted at the February 2006 regular meeting of the UDC.

d. Project Description

The City of Richmond currently operates a sludge thickening facility and a sludge dewatering facility at its Wastewater Treatment Plant (WWTP). The facilities were installed in the late 1980's. Greeley and Hansen designed both the thickening and dewatering facilities and they have been in continuous operation for over 30 years.

The thickening and dewatering centrifuges are near the end of their service life, and down time for maintenance has become excessive and costly. The City selected Greeley and Hansen to develop a basis of design report for upgrades to both facilities. Greeley and Hansen developed a report with an evaluation of current and future flow conditions, a characterization of existing equipment condition, a detailed review of multiple centrifuge manufactures, and a recommendation for facility upgrades.

The scope of the current project includes the following upgrades in the thickening facility: Replacement of four thickening centrifuges, new centrifuge control panels elevated on a platform above the 100-yr flood plain, replacement of four progressing cavity sludge pumps, new electrical building and transformers above 100-yr flood plain elevation adjacent to the existing facility, and a new outdoor HVAC platform above 100-yr flood plain elevation adjoining the existing facility. The thickening centrifuges will be replaced with the current facility in operation and would not require a temporary thickening facility. The existing windows will be replaced in kind, and interior upgrades to office space and control rooms are proposed.

The scope of the project includes the following upgrades to the dewatering facility: Replacement of five dewatering centrifuges, new centrifuge control panels and centrifuges on platform above 100-year flood plain elevation, new dewatering polymer system, new dewatered cake conveyer system, a new loading building, a new Integrated Power Assembly unit above the 100-yr flood plain elevation. Other supporting systems that need to be upgraded are central drains, noise reduction system in the centrifuge room, I&C Systems, and HVAC System. A temporary dewatering system will be constructed to the west of the current facility to allow the rehabilitation of the dewatering building to be conducted without coordinating a difficult phased construction approach.

Windows will be replaced in kind, and interior updates to office spaces and laboratory are being proposed.

e. Master Plan

This property is within the Old South Planning District. The current Master Plan calls for industrial uses at this location. It is appropriate for a wastewater treatment facility to be located at this site.

f. Urban Design Guidelines

In matters of public facilities the Urban Design Guidelines encourage consistency with the existing architectural massing, character, and materials. Building colors should be coordinated and compatible with adjacent buildings.

Staff finds that the final design of the new loading building adjacent to the dewatering facility and the new electrical building and HVAC platform adjacent to the Sludge Thickening Building, are in-keeping with the industrial aesthetic of the site.

The Urban Design Guidelines state that, "Facilities required for the ongoing operation of the building, such as loading docks, maintenance sheds, or HVAC equipment" should be screened from view or located in the rear. All new electrical and HVAC equipment proposed in this project is either screened or located in a location that is minimally visible.
